CLAIMS

conducting a test.

- 69. (Previously submitted) The test strip of claim 68 in which said fill line is formed by an opaque portion overlying a portion of the capillary test chamber.
- 70. (Previously submitted) The test strip of claim 69 in which the fill line extends at a location between the working electrode and the vent.
- 71. (Previously submitted) The test strip of claim 70 in which said fill line is formed by an opaque portion overlying a portion of the capillary test chamber.
- 72. (Previously submitted) The test strip of claim 68 in which said strip body includes opposed sides of the capillary channel, the sides being parallel and extending in a straight line from the sample application port, and orthogonal to the perimetric edge surface, to at least one of the electrodes, the fill line extending across the capillary channel in an orientation orthogonal to the opposed sides of the capillary channel.
- 73. (Previously submitted) The test strip of claim 72 in which said strip body further includes opaque portions generally aligned with the opposed sides of the capillary channel from adjacent the sample application port to at least one of the electrodes.
- 74. (Previously submitted) The test strip of claim 73 in which the opaque portions are spaced apart to reveal greater than about 75% of the width of the capillary channel.
- 75. (Previously submitted) The test strip of claim 68 in which said strip body includes a first substrate, a second substrate and a roof, the second substrate being positioned intermediate the first substrate and the roof and including an opening, the opening of the second substrate together with the first substrate and the roof defining the capillary channel.
- 76. (Previously submitted) The test strip of claim 75 in which said test strip includes conductive tracks connected with said working and counter electrodes, the first substrate having first and second surfaces, the working and counter electrodes being affixed to

the first surface of the first substrate, the second substrate having first and second surfaces and an opening, the second surface of the second substrate being affixed to the first surface of the first substrate, the second substrate configured to expose a portion of the conductive tracks for electrical connection to a meter capable of measuring an electrical property, the opening being located along a perimetric edge surface of the second substrate and exposing said electrodes, and a roof having first and second surfaces and including a solid, transparent or translucent viewing material, the second surface of the roof being affixed to the first surface of the second substrate and positioned so that it overlays the opening of the second substrate and so that the second surface of the roof and the first surface of the first substrate form opposing walls of the capillary channel, the transparent or translucent viewing material extending from at least adjacent to the sample application port and overlying the entire width of one of the electrodes and at least about ten percent of the width of the other electrode.

- 77. (Previously submitted) The test strip of claim 75 in which the second substrate defines opposed sides of the capillary channel, the sides being parallel and extending in a straight line from the sample application port, and orthogonal to the perimetric edge surface, to at least one of the electrodes.
- 78. (Previously submitted) The test strip of claim 77 in which said test strip further includes opaque portions generally aligned with the opposed sides of the capillary channel from adjacent the sample application port to at least one of the electrodes, the fill line extending across the capillary channel in an orientation orthogonal to the opposed sides of the capillary channel.
- 79. (Previously submitted) The test strip of claim 78 in which the opaque portions are defined by the roof.

80. (Previously submitted) The test strip of claim 75 in which the opening of the
second substrate defines opposed sides of the capillary channel, said visualization means
including opaque portions generally aligned with the opposed sides of the capillary channel
extending from adjacent the sample application port to at least one of the electrodes, the
opaque portions being located in the area adjacent the capillary channel, the opaque portions
having a color which contrasts with the color of the sample as observed through the viewing
material,
whereby a user is able to visually locate the sample within the capillary channel by
observation through the viewing material and is able to determine when the sample has filled
the capillary channel at least up to the fill line.
81. (Previously submitted) The test strip of claim 80 in which the opposed sides of
the capillary channel are parallel and extend in a straight line from the sample application
port, and orthogonal to the perimetric edge surface, to at least one of the electrodes, and the
fill line extends across the capillary channel in an orientation orthogonal to the opposed sides
of the capillary channel.
82. (Currently amended) An electrochemical test strip for conducting testing for
the concentration of an analyte in a blood sample, comprising:
a strip body including an edge surface extending about the perimeter of said strip
body, said strip body defining a capillary channel and a vent in fluid communication with the
capillary channel, said strip body comprising a sample application port open at a location
along the edge surface, the capillary channel extending from the sample application port at
least to the vent;

at least working and counter electrodes spaced from each other and positioned within
the capillary channel at a location spaced from the perimetric edge surface; and
a test reagent adjacent at least the working electrode;
a solid, transparent or translucent viewing material extending from at least adjacent the
sample application port and overlying at least a portion of the capillary channel, said strip
body defining a viewing area comprising a portion of the viewing material allowing
continuous visualization of the capillary channel from a portion thereof at or generally
adjacent the sample application port, up to and including said working electrode and at least a
portion of said counter electrode,
the viewing area being positioned and dimensioned such that blood introduced to the
capillary channel through the sample application port and filling the viewing area at least up
to a portion of said counter electrode under the viewing area is required for the test strip to
have a sufficient blood sample to conduct a test,

said strip body further including a fill line extending across the viewing area at a location intermediate the length of the capillary channel at a position such that movement of the blood sample to the fill line indicates sufficient filling of the test strip for conducting a test.

- 83. (Previously submitted) The test strip of claim 82 in which said fill line is formed by an opaque portion overlying a portion of the capillary test chamber.
- 84. (Previously submitted) The test strip of claim 83 in which the fill line extends at a location between the working electrode and the vent.
- 85. (Previously submitted) The test strip of claim 84 in which said fill line is formed by an opaque portion overlying a portion of the capillary test chamber.

86. (Previously submitted) The test strip of claim 82 in which said strip body
includes opposed sides of the capillary channel, the sides being parallel and extending in a
straight line from the sample application port, and orthogonal to the perimetric edge surface,
to at least one of the electrodes, the fill line extending across the capillary channel in an
orientation orthogonal to the opposed sides of the capillary channel.
87. (Previously submitted) The test strip of claim 86 in which said strip body
further includes opaque portions generally aligned with the opposed sides of the capillary
channel from adjacent the sample application port to at least one of the electrodes.
88. (Previously submitted) The test strip of claim 87 in which the opaque portions
are spaced apart to reveal greater than about 75% of the width of the capillary channel.
89. (Previously submitted) The test strip of claim 82 in which said strip body
includes a first substrate, a second substrate and a roof, the second substrate being positioned
intermediate the first substrate and the roof and including an opening, the opening of the
second substrate together with the first substrate and the roof defining the capillary channel.
90. (Previously submitted) The test strip of claim 89 in which said test strip
includes conductive tracks connected with said working and counter electrodes, the first
substrate having first and second surfaces, the working and counter electrodes being affixed to
the first surface of the first substrate, the second substrate having first and second surfaces and
an opening, the second surface of the second substrate being affixed to the first surface of the
first substrate, the second substrate configured to expose a portion of the conductive tracks for
electrical connection to a meter capable of measuring an electrical property, the opening being
located along a perimetric edge surface of the second substrate and exposing said electrodes,
and a roof having first and second surfaces and including a solid, transparent or translucent

viewing material, the second surface of the roof being affixed to the first surface of the second substrate and positioned so that it overlays the opening of the second substrate and so that the second surface of the roof and the first surface of the first substrate form opposing walls of the capillary channel, the transparent or translucent viewing material extending from at least adjacent to the sample application port and overlying the entire width of one of the electrodes and at least about ten percent of the width of the other electrode.

- 91. (Previously submitted) The test strip of claim 89 in which the second substrate defines opposed sides of the capillary channel, the sides being parallel and extending in a straight line from the sample application port, and orthogonal to the perimetric edge surface, to at least one of the electrodes.
- 92. (Previously submitted) The test strip of claim 91 in which said test strip further includes opaque portions generally aligned with the opposed sides of the capillary channel from adjacent the sample application port to at least one of the electrodes, the fill line extending across the capillary channel in an orientation orthogonal to the opposed sides of the capillary channel.
- 93. (Previously submitted) The test strip of claim 92 in which the opaque portions are defined by the roof.
- 94. (Previously submitted) The test strip of claim 89 in which the opening of the second substrate defines opposed sides of the capillary channel, said visualization means including opaque portions generally aligned with the opposed sides of the capillary channel extending from adjacent the sample application port to at least one of the electrodes, the opaque portions being located in the area adjacent the capillary channel, the opaque portions

having a color which contrasts with the color of the sample as observed through the viewing
material,
whereby a user is able to visually locate the sample within the capillary channel by
observation through the viewing material and is able to determine when the sample has filled
the capillary channel at least up to the fill line.
95. (Previously submitted) The test strip of claim 94 in which the opposed sides of
the capillary channel are parallel and extend in a straight line from the sample application
port, and orthogonal to the perimetric edge surface, to at least one of the electrodes, and the
fill line extends across the capillary channel in an orientation orthogonal to the opposed sides
of the capillary channel.
96. (Previously submitted) An electrochemical test strip for conducting testing for
the concentration of glucose in a blood sample, comprising:
a strip body including an edge surface extending about the perimeter of said strip
body, said strip body defining a capillary channel and a vent in fluid communication with the
capillary channel, said strip body comprising a sample application port open at a location
along the perimetric edge surface, the capillary channel extending from the sample application
port to at least the vent, said strip body further defining a test area along the capillary channel
between the sample application port and the vent;
at least working and counter electrodes spaced from each other and positioned within
the test area of the capillary channel at a location spaced from the perimetric edge surface;
a test reagent received within the test area of the capillary channel and adjacent at least
the working electrode;

said strip body including a solid, transparent or translucent viewing material overlying
at least a portion of the capillary channel, including from a portion thereof at or generally
adjacent the sample application port continuously up to and including said working electrode
and at least a portion of said counter electrode, the viewing material permitting visualization
of the blood sample as it moves through the capillary channel to the test area;
said strip body further including opaque portions defining a fill area viewable through
the viewing material, the fill area comprising an area of the capillary channel needed to be
filled to conduct an accurate test; and
a fill line extending across the capillary channel at a location intermediate the length
of the capillary channel at a position such that movement of the blood sample to the fill line
indicates sufficient filling of the test strip for conducting a test.
wherein observation through the viewing material of the blood sample within the
capillary channel up to said electrodes comprises confirmation of sufficient blood sample
being introduced into the capillary channel to conduct a test.
97. (Previously submitted) The test strip of claim 96 in which said fill line is

- 97. (Previously submitted) The test strip of claim 96 in which said fill line is formed by an opaque portion overlying a portion of the capillary test chamber.
- 98. (Previously submitted) The test strip of claim 96 in which the fill line extends at a location between the working electrode and the vent.
- 99. (Previously submitted) The test strip of claim 98 in which said fill line is formed by an opaque portion overlying a portion of the capillary test chamber.
- 100. (Previously submitted) The test strip of claim 96 in which the fill line extends at a location between the test area and the vent.

101. (Previously submitted) The test strip of claim 100 in which said fill line is
formed by an opaque portion overlying a portion of the capillary test chamber.
102. (Previously submitted) The test strip of claim 96 in which the opaque portions
are sized and dimensioned such that the blood sample is required to fill up to the fill line the
portion of the capillary channel viewable through the viewing material in order to have a
sufficient amount of blood sample to conduct a test.
103. (Previously submitted) The test strip of claim 96 in which the opaque portions
extend continuously in alignment with the opposed sides of the capillary channel from the
perimetric edge surface to the electrodes.
104. (Previously submitted) The test strip of claim 96 in which the opaque portions
are sized and dimensioned such that the blood sample is required to fill up to the fill line the
portion of the capillary channel viewable through the viewing material in order to have a
sufficient amount of blood sample to conduct a test.
